Excerpt: . . . and gradually bent, gives a well-defined fibrous fracture; while, if nicked on all four sides and suddenly broken, the fracture will be crystalline. But these are well-known tricks of the trade. The fracture, when performed under definite conditions, furnishes a true indication of the coarseness of the crystallization. The degree of coarseness of the fracture, or the average size of the crystalline grains when a suitably prepared specimen is examined under the microscope, is called the grain size of the specimen. As a general rule, the smaller the grain size the better the steel, and we naturally ask: Is there any relation between the grain size and the highest temperature to which the steel has been heated in annealing For practical purposes the physical properties of steel may be taken to depend upon--Fig. 39. --Iron with 13 per cent. Here are a few tests, by Sauveur, on the relation between the size of the grain and the physical properties of the same piece of steel: 1--The relation between the average area and the tenacity is--Tenacity 75 5-0 004 A. An experienced man can generally give a surprisingly accurate guess of the temperature to which the steel has been heated, from the fracture, or...
